

Research Compendium

Introduction

We will act as though we have very useful things to say about simulation studies here. In fact, so useful that we even include an equation, which shows just how useful equations are:

$$U = \frac{N_E^2}{F},$$

where U is usefulness, N_E is the number of equations, and F is the amount of effort expended. I think we are now ready to move on to our results! Methods are overrated anyway.

Results

Here are some results from our simulation study:
